

Instructions for submission

Clinical Image

Clinical Image

The Clinical Image section represents a photograph of a typical clinical phenomenon or sign, accompanied by a concise description of relevant information (e.g. initial presentation, medical history, examination). Four plausible options (e.g. diagnoses) are given. The student should be able to give a correct answer based on image and description.

In total 3 relevant questions should be added to the case. Additionally, a hint to each question is preferred, depending on the complexity of the question.

The correct option needs an explanation with a short conclusion and some information about the particular disease or condition. Furthermore, for each wrong option, a clear and short explanation should be given about why these options are not correct.

The answers and explanations will be added at the last page of each edition (and not at the same page as the Clinical Image). Please take this into consideration when writing your explanation.

The patient should again be unidentifiable and informed written consent should be obtained (see Appendix II).

Maximum amount of words for the case description (without questions): 50

Please submit your Clinical Image as a Word-document via www.amsj.nl and add your clinical image as a .png file. Images should have a minimum resolution of 150 DPI. A resolution of 300 DPI is preferred.
